

Hydrogen Refuelling Station in Aalborg

During our last meeting in Aalborg (1 November 2019 you visited our Hydrogen Refuelling station.

The hydrogen refueling station has now been up and running since the beginning of January. All permits are obtained, and it has gone through several tests both with and without the fuel cell bus. All issues have now been solved, which means we have a fully functional Station to refuel the fuel cell buses.

After several delays we have now received the first fuel cell bus, which will be operating as a city bus in the center of Aalborg. The last two buses, which will be operating on the regional routes, will be delivered this week (week 8). All three buses are expected to be in operation at the beginning of March. Both drivers and mechanics from the operators Keolis and Arriva have been educated in the fuel cell technology and hydrogen.

The three fuel cell buses and the Refueling station will be demonstrated at the inauguration event in Aalborg - 20th March - where both partners in the 3Emotion project, politicians, the Minister of Transport and other stakeholders will be present.

The buses are expected to run for three years, and will collect valuable data and experiences in order to test whether fuel cell buses and the potential of hydrogen as green energy, can be an option in future public transport solutions in North Denmark Region.

Our Masterplan for sustainable mobility will be on The agenda in The Regional Council next week.
